DETAILED ACTION

1. This Office Action is in response to the Priority filed on 2/4/99 and the Corrected Filing Receipt filed on 7/21/99.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35
 U.S.C. 102 that form the basis for the rejections under this section made in this
 Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102

- (e) by the American Inventors Protection Act of 1999 (AIPA) do not apply to the examination of this application as the application being examined was not (1) filed on or after November 29, 2000, or (2) voluntarily published under 35 U.S.C. 122(b). Therefore, this application is examined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).
- 3. Claims 1, 10, and 11 are rejected under 35 U.S.C. 102(e) as being anticipated by Borman, U.S. Patent No. 5,890,172, filed Oct. 8, 1996, published Mar. 30, 1999.

Regarding independent claim 1, Borman discloses "obtaining information using address information", such as a **URL**, as on column 5, line 60, defined on an "information network," such as the **Internet**, as on column 5, line 51, and "outputting the thus-obtained information," such as a **browser user I/O handles**

Application/Control Number: 09/244,043

Art Unit: 2176

the task of translating files received from the Internet, e.g., HTML encoded files, to the presenter, as on column 6, lines18-20. Furthermore, Borman discloses "informing the address information to the browser means according to a predetermined output sequence, and for instructing output of information corresponding to the thus-informed address information," such as when a start time button initiates the automatic and successive selection of every hotlink on the parsed list and the browser responsive thereto, displays for the user a file retrieved from the URL corresponding to each hot-link, as on column 7, lines 11-15.

Regarding dependent claim 10, Borman discloses a "browser means" to obtain "information via a communication network using address information," as a browser outputs an URL, which contains the address information, across outgoing Internet line, or communication network, and communications with the Internet are received on incoming Internet line, as on column 5, lines 60-61 and 63-64.

Regarding dependent claim 11, Borman discloses "a storage means for storing information to be outputted," such as a **storage contains a storage segment in which the jumper stores parsed HTML files**, as on column 6, lines 2-3, and also the browser that "obtains information which is stored in the storage means using address information," as the **browser handles Internet communications for the** jumper, as on column 6, lines 17-18, and the **browser user I/O uploads at the direction of jumper user I/O**, as on column 6, lines 23-24.

Application/Control Nun er: 09/244,043

Art Unit: 2176

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 2-7 and 12-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Borman.

Regarding dependent claim 2, Borman discloses storing means, where a jumper stores parsed HTML files, as on column 6, line 3, as well as storing "address information," such as when the parser extracts ... a plurality of URLs, as on column 6, line 31. However, Borman does not expressly disclose correspondence relationship between an address and a sequence number. However, Borman discloses that a user can initiate a successive selection of every hot-link on the parsed list, and also allows the "control means" that "determines address information to be informed to the browser means," as Borman discloses the browser responsive thereto, displays for the user a file retrieved from the URL, as on column 7, lines 13-14. Clearly a successive selection of hot-links would need a sequence number stored with the addresses in order to know the correct succession of HTML files to load.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use sequence numbers corresponding with Borman's HTML slide-show, to display information. One of ordinary skill in the

Application/Control Number: 09/244,043

Art Unit: 2176

art would have been motivated to do this because in order to successively display files, a program would have needed to, at the minimum, internally store sequence numbers in order to know which the previous and next files to display would be.

Regarding dependent claim 3, a slide show system is disclosed above, and furthermore, Borman discloses an "operation means " and "control means" for a "user to specify information to be outputted next," where the address information is sent to the browser, as a **Next entry button selects the next hot-link on the list**, as on column 7, lines 9-10.

Regarding dependent claim 4, Borman discloses "information pieces before and after information currently being outputted," as a user can select on a list the information before or after, or explicitly select on a list the elements before and after the current outputted information, by using a **Previous entry button**, a **Next entry button**, or a **Button bar**, as on column 9, lines 6-7, 9-10, and column 6, lines 63-64.

Regarding dependent claim 5, Borman discloses the "control means informs the ... address information to the browser means according to the output sequence," as the automatic and successive selection of every hot-link on the parsed list and the browser responsive thereto, displays for the user a file retrieved form the URL corresponding to each hot-link, as in column 7, lines 12-15.

Regarding dependent claim 6, Borman discloses the slide show system means to have the browser use the address information to display the

Art Unit: 2176

Page 6

information at "prescribed time intervals," as the jumper directs the browser to access and display in the browser window ... files ... accessed by the browser in response to the jumper sending at timed intervals each of hot-links, as on column 5, lines 36-40.

Regarding dependent claim 7, Borman discloses the time intervals and the sequence numbers, as explained above; however, Borman does not expressly disclose the time intervals changing according to the sequence numbers. However, it is clear that the timed intervals are related to the sequence numbers as it is explained that the parsed list of URLs is displayed sequentially based on time intervals. Therefore, if the sequence or elements of the hot-list were to change, then clearly the time intervals would change with them.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to have the time intervals change according to the sequence number. One of ordinary skill in the art would have been motivated to do this because in order to keep elements in a sequential list synchronized, the time intervals related to a sequence number must be consistent throughout execution of the display of the sequential list.

Regarding independent claim 12, Borman discloses a computer-readable storage medium which stores a program with "address information defined on an information network," as the client for both the browser and the jumpers ... contains storage, computational hardware, operating system, and GUI and is connected to the Internet, as on column 5, line 64 and lines 65-67 and column 6, line 1. Borman does not expressly disclose correspondence relationship

Page 7

Application/Control Number: 09/244,043

Art Unit: 2176

between an address and a sequence number. However, Borman discloses that a user can initiate a successive selection of every hot-link on the parsed list, and also allows the "control means" that "determines address information to be informed to the browser means," as Borman discloses the browser responsive thereto, displays for the user a file retrieved from the URL, as on column 7, lines 13-14. Clearly a successive selection of hot-links would need a sequence number stored with the addresses in order to know the correct succession of HTML files to load.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use sequence numbers corresponding with Borman's HTML slide-show, to display information. One of ordinary skill in the art would have been motivated to do this because in order to successively display files, a program would have needed to, at the minimum, internally store sequence numbers in order to know which the previous and next files to display would be.

Regarding independent claim 13, Borman discloses a computer-readable storage medium referring to a correspondence relationship between address information and a sequence number, and is rejected similarly above.

Furthermore, Borman discloses "obtaining information using address information" and "outputting the ... information," as a browser ... displays for the user a file retrieved from the URL corresponding to each hot-link, as on column 7, lines 13-15. Although Borman does not expressly disclose the sequence number, the

Application/Control Number: 09/244,043

Art Unit: 2176

use of the sequence number correlated to the address information is disclosed above and is similarly rejected.

Regarding independent claim 14, Borman discloses a slide show method directed to claim 12 above, and is similarly rejected, as "obtaining information using address information corresponding to a current sequence number" is the same as "obtaining address information corresponding to a sequence number" and "obtaining address information using the address information."

6. Claims 8-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Borman as applied to claim1 above, and further in view of Gorbet, U.S. Patent No. 6,072,480, filed Nov. 5, 1997, published Jun. 6, 2000, and Qureshi, U.S. Patent No. 6,084,582, filed Jul. 2, 1997, published Jul. 4, 2000.

Regarding dependent claim 8, Borman discloses the slide show system for obtaining address information for display in a predetermined output sequence; however, Borman does not disclose outputting music and narration with the output information. However, Gorbet discloses a mechanism for playing music soundtracks to accompany an electronic slide show, as on column 3, lines 66+ and column 4, line 1, and Qureshi discloses a mechanism for recording audio, in particular audio narration, to accompany a set of slides stored on a computer storage medium, as on column 3, lines 35-37.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine Gorbet's and Qureshi's different audio files to accompany Borman's slide show system. One of ordinary skill in the art would have been motivated to do this because clearly it was common at

Application/Control Nurser: 09/244,043

Art Unit: 2176

the time the invention was made to link audio, whether it is music or narration, with electronic slideshow systems. Therefore, in order to give a user the greatest flexibility in viewing slideshows, with information taken from addresses on a communication network, it would have been necessary to have the features of providing an audio accompaniment.

Regarding dependent claim 9, a slide show system with sound output is disclosed above; however, Borman does not expressly disclose the sound information being outputted according to the sequence number. However, Gorbet and Qureshi disclose the sound output that is associated with the slides, as explained above, and the sequence numbers are also related to the link addresses, also disclosed above.

Therefore, at the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine Gorbet and Qureshi's sound files with Borman's sequence numbers and address links. One of ordinary skill in the art would have been motivated to do this because the address links and slides are associated to the sound files, and the address links are also associated with the sequence numbers. Therefore, in order to keep objects synchronized, they must be centered on a unique identifier, either a sequence number or the unique address link name.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
